

PATENT

Customer No. 22,852

Attorney Docket No. 8680-0001-00

41. (NEW) The multiparticulate bisoprolol formulation according to claim 40, wherein the polymeric coating further comprises at least one pharmaceutically acceptable film-forming polymer that forms an insoluble film of high permeability.

42. (NEW) The multiparticulate bisoprolol formulation according to claim 40, wherein the at least one pharmaceutically acceptable film-forming polymer that forms an insoluble film of low permeability is present in an amount greater than the amount of any pharmaceutically acceptable film-forming polymers that form an insoluble film of high permeability.

REMARKSStatus of Claims

In the Final Office Action, the Office indicated that claims 1-24 and 28-30 were pending, and that claims 26 and 27 were withdrawn from consideration. The Office rejected claims 1-24 and 28-30. By the present Amendment, claims 2 and 9 are canceled, claims 1, 3-8, 10-25, and 28-30 are amended, and new claims 31-42 are added. Thus, claims 1, 3-8, 10-25, and 28-42 are pending following entry of this amendment.

Personal Interview with Examiner

On February 19, 2002, a personal interview was held between Applicants' representative, Examiner Joynes, and the Examiner's supervisor. Applicants express appreciation to the Examiner and his supervisor for the courtesy extended to Applicants' representative at the interview.

PATENT
Customer No. 22,852
Attorney Docket No. 8680-0001-00

At the interview, proposed amendments to claim 1 were presented and discussed. The present amendment includes those amendments, except that the phrase, "at least two," has been deleted from claim 1.

Amendment to Specification

The amendment to the specification at page 40 corrects typographical errors in the legend for the data shown in Figures 1 and 2. Prior to correction, the legend on page 40 misidentified the results shown in the Figures with the specific Examples that generated those results. The present amendment corrects the previous errors, and the legend now correctly identifies the data in the Figure with the specific Example from which the data came.

Applicants respectfully submit that this correction does not add new matter. The Examples in the specification were performed and produced the data shown in Figures 1 and 2, yet the specific examples from which the data was obtained were mislabeled in the Figures. Because the results of the Examples are reproducible, one of ordinary skill in the art would immediately recognize the proper correlation of Examples with data, and would immediately recognize Applicants' typographical error on page 40. Thus, this amendment finds support in the original disclosure provided by the examples, and no new matter is added. Accordingly, Applicants respectfully request entry of the foregoing amendments in the specification.

Amendments to the Claims

Claims 1, 3-8, 10-25, and 28-30 are amended, and new claims 31-42 are added by this amendment. Support for these amendments and new claims is found throughout the specification. However, in an attempt to advance prosecution and to

Attorney Docket No. 8680-0001-00

assist the Office in evaluating the proposed amendments and new claims. Applicants have identified the following particular passages and sections of the application which provide support for the amendments.

For the element of claim 1 relating to "a bisoprolol plasma concentration of not more than about 1 ng/ml for at least about three hours," attention is directed to page 3, lines 17-20. For the reference to a "sustained release" of the formulation of claim 1, attention is directed to the dissolution results shown for Examples 2, 3, 4, and 5 in Figures 1 and 2. For claim 1's recitation of a "therapeutic plasma concentration not later than about 12 hours," and for the "therapeutic plasma concentration for the remainder of a twenty-four hour period," Applicants refer to the plasma concentrations shown in, for example, Figure 3.

For new claims 31-34, which recite pH-dependent and pH-independent formulations, Applicants refer to page 11, lines 11-20. For new claim 35, reference is made to the plasma concentrations shown in Figure 3. For claim 36, and its reference to talc, Applicants refer to page 14, lines 13-16. For the recitation of substantially purified forms of bisoprolol in claims 37-39, Applicants refer to page 14, lines 20-24. And for the recitation, in new claims 40-42, of different polymers used in the formulation, reference is made to page 12, lines 12-18. Accordingly, no new matter is presented by any of these amendments or new claims, and their entry is respectfully requested.

Claim Rejections – 35 U.S.C. § 112

The Office has rejected claims 10-14 and 28-30 under 35 U.S.C. § 112, second paragraph, as being indefinite. In particular, the Office alleges that claims 10 and 11 are indefinite for reciting "major portion" and "minor portion," respectively. Claims 12-14

Customer No. 22,852

Attorney Docket No. 8680-0001-00

and 28-30 are alleged to be indefinite for the recitation of "said polymers" or "the or each polymer," each of which the Office states lacks antecedent basis.

In response, Applicants have amended each of the rejected claims to address the rejected terms and more clearly define that which Applicants consider to be their invention. Claims 10 and 11 have been amended to recite a specific percentage of polymer, instead of "major" or "minor" portions. Support for the amendments to claims 10 and 11 can be found, for example, at page 12, lines 12-18. Claims 12-14 and 28-30 have been amended to more clearly define the claimed invention and recite proper antecedent basis. Applicants respectfully submit that these amendments obviate the rejections, and thus respectfully request the withdrawal of the rejections under 35 U.S.C. § 112, second paragraph.

Claim Rejections – 35 U.S.C. § 102

The Office has rejected claims 1-8, 10-25, and 28-30 under 35 U.S.C. § 102(e) as allegedly anticipated by Busetti et al. (WO 98/32436).¹ The Office relies upon Busetti et al. for allegedly anticipating several elements of Applicants' claimed invention.

Applicants respectfully disagree with each of the Office's allegations, and submit that Busetti et al.'s disclosure differs significantly from Applicants' claimed invention. Busetti et al. discloses pharmaceutical formulations exhibiting a delayed release. The delay is achieved by coating a core with a swellable polymeric coating, the thickness of

¹ Applicants respectfully note that a proper rejection under 35 U.S.C. § 102(e) can only be made over a U.S. patent or application. Thus, Applicants assume that the reference to the rejection under 35 U.S.C. § 102(e) means that the Office has relied on U.S. Patent No. 5,891,474, which is the U.S. patent that issued from the application referred to on the face of the cited WO document. However, Applicants respectfully request that

Attorney Docket No. 8680-0001-00

which is taught to determine the length of the release delay. Upon expiration of the predetermined delay time, Busetti et al.'s polymeric coating has completely eroded or dissolved, allowing for a fast dissolution of the core. Busetti et al. provides no teaching for modifying the rate of release following the initial delay/lag, and in fact, emphasizes that the core should rapidly disintegrate following coating dissolution.

For example, Busetti et al. notes that once the lag time has lapsed, "the coating layer should be almost completely dissolved or eroded so that the core should be capable of relatively quick disintegration." (Busetti et al., page 12, line 30 to page 13, line 1.) Furthermore, Example 1 results in a dissolution time lag of 302 ± 56 minutes, and a "disintegration time lower than 5 min." for the cores that were coated. Example 3 results in a "dissolution time lag in excess of 300 min., followed by a quick disintegration of the tablet." Example 4 describes how cores having a "disintegration time lower than 5 min." are coated to achieve the desired time lag. Example 5 describes a "disintegration time lag in excess of 300 min." Example 7 describes the coating of cores that "show a disintegration time lower than 5 min. in water," where the disintegration time lag is in excess of 5 hours. In example 8, the results show a "disintegration time lag in excess of 6 hours." Example 9 describes the coating of cores having disintegration times lower than "5 min. in water," where the "disintegration time lag" was in excess of 6 hours. Example 10 describes the results from a coated capsule formulation, in which the "coated capsules showed a dissolution time in excess of 240

the Office expressly indicate that both the WO document and the U.S. Patent were considered.

PATENT
Customer No. 22,852
Attorney Docket No. 8680-0001-00

min., followed by a quick disintegration of the capsule." Examples 11, 12, 14, and 15 all refer to a "disintegration time lag," and Example 13 refers to a "dissolution time lag."

Even the comparative examples of Busetti et al. describe a delay in release followed by a quick disintegration: Example 2 describes how the "coated tablets show a dissolution time lag in excess of 300 min., followed by a quick disintegration of the tablet;" Example 6 describes a "disintegration time lag in excess of 300 min."

Clearly, Busetti et al. does not teach how to modify the rate of release after the initial time lag. All that Busetti et al. is concerned with is the initial delay in release, and indeed, states the desirability of achieving a very rapid release of the drug in the core. However, such a rapid release of the core contents can result in a spike in plasma drug concentration, followed by a decrease over a period of time until the next administration. The ultimate result can be undesirable peaks and valleys in plasma drug concentration over an extended period of dosing.

In contrast, the present invention provides a desired delay in release, but also then provides for a sustained release of the drug from the formulation for a desired period of time. This sustained release period allows for a more gradual introduction of bisoprolol into the body and a more gradual peak in plasma concentration, followed by a more gradual decrease in plasma bisoprolol concentration over the desired dosing period. Over repeated daily use, the present formulation minimizes peaks and valleys in plasma bisoprolol concentration.

Accordingly, Applicants respectfully submit that the presently claimed invention is not anticipated by Busetti et al., and respectfully request the withdrawal of the rejection under 35 U.S.C. § 102.

Fax 202.408.4400
www.finnegan.com

PATENT

Customer No. 22,852

Attorney Docket No. 8680-0001-00

Claim Rejections – 35 U.S.C. § 103

The Office has rejected claims 1-8, 10-25, and 28-30 under 35 U.S.C. § 103(a) as being unpatentable over Busetti et al. In response, Applicants respectfully traverse the rejection and submit that Busetti et al. does not render any of the claims obvious.

As noted above, Busetti et al. discloses pharmaceutical formulations exhibiting a delayed release. The delay is achieved by coating a core with a swellable polymeric coating, the thickness of which is taught to determine the length of the delay. Upon expiration of the pre-determined delay time, Busetti et al.'s polymeric coating has completely eroded or dissolved, allowing for a fast dissolution of the core. Busetti et al. provides no teaching for modifying the rate of release following the initial delay, and in fact, emphasizes that the core should rapidly disintegrate following coating dissolution.

Furthermore, as noted above, Applicants' claimed invention is directed to a formulation that, following an initial delay in release, provides for a sustained release of bisoprolol over a period of time, thereby affording the maintenance of therapeutic concentrations in the plasma for the remainder of a twenty-four hour period. Thus, a significant difference between Applicants' claimed invention and Busetti et al.'s disclosure is the characteristic drug release following the initial delay: Busetti et al.'s is immediate and fast, whereas Applicants' is gradual and sustained.

Notably, Busetti et al. does not provide any teaching or suggestion as to the possibility, much less the desirability, of a gradual and sustained release following administration. There is nothing in Busetti et al. that would lead one of skill in the art to modify the rate of release of the drug from the core following the dissolution/erosion of the coating. If one were to follow the teachings and suggestions of Busetti et al., one

FINNEGAN

PATENT

Custom r No. 22,852
Attorney Docket No. 8680-0001-00

would logically seek to minimize the time it takes for the core to dissolve. Furthermore, one would optimize the core so as to produce an even quicker dissolution. This is clearly Busetti et al.'s design.

In fact, if one were to follow the teachings and suggestions of Busetti et al., one could not arrive at the present invention. Busetti et al. leads the skilled artisan in the opposite direction of the present invention. Busetti et al. teaches that the cores desirably release their drug component as quickly as possible, whereas the present invention achieves a release of the drug from the formulation that is gradual and sustained. If anything, Busetti et al. teaches away from the present invention. And courts have long recognized that a document that teaches away from a claimed invention cannot render that claimed invention obvious.

In view of the foregoing, Applicants respectfully submit that Busetti et al. does not render the claimed invention obvious, and Applicants respectfully request the withdrawal of the rejection of claims 1-8, 10-25, and 28-30 under 35 U.S.C. § 103.

The Office has also rejected claim 9 under 35 U.S.C. § 103(a) as being unpatentable over Busetti et al. in view of Noda et al. (U.S. Patent No. 5,137,733). Applicants respectfully submit that the combination of Busetti et al. and Noda et al. does not render the invention of claim 9 obvious. However, solely in an effort to advance prosecution, Applicants have canceled claim 9, thereby obviating the rejection.

Accordingly, Applicants request its withdrawal.

Conclusion

Applicants respectfully request that this Amendment under 37 C.F.R. § 1.116 be entered by the Examiner, placing claims 1, 3-8, 10-25, and 28-42 in condition for

PATENT
Customer No. 22,852
Attorney Docket No. 8680-0001-00

allowance. Applicants submit that the proposed amendments of claims 1, 3-8, 10-25, and 28-30 do not raise new issues or necessitate the undertaking of any additional search of the art by the Examiner, since all of the elements and their relationships claimed were either earlier claimed or inherent in the claims as examined. Therefore, this Amendment should allow for immediate action by the Examiner.

Furthermore, Applicants respectfully point out that the final action by the Examiner presented some new arguments as to the application of the art against Applicants' invention. It is respectfully submitted that the entering of the Amendment would allow Applicants to reply to the final rejections and place the application in condition for allowance.

Finally, Applicants submit that entry of the Amendment would place the application in better form for appeal, should the Examiner dispute the patentability of the pending claims.

In view of the foregoing remarks, Applicants submit that this claimed invention, as amended, is neither anticipated nor rendered obvious in view of the documents cited against this application. Applicants therefore request the entry of this Amendment, the Examiner's reconsideration and reexamination of the application, and the timely allowance of the pending claims.

Please grant any extensions of time required to enter this response and charge any additional required fees to our deposit account 06-0916.

Appendix to Amendment**A. The specification is amended as follows:**

The paragraph at page 40, lines 16-24, is amended as follows:

The results are shown in Figs. 1 and 2 wherein:

A = The product of Example [2] 5

B = The product of Example [3] 2

C = The product of Example 4

D = The product of Example [5] 3.

B. The claims are amended as follows:

1. (ONCE AMENDED) A multiparticulate bisoprolol formulation for once-daily oral administration, [each particle] said formulation comprising at least two particles comprising a core of bisoprolol or a pharmaceutically acceptable salt thereof, [surrounded by] and a polymeric coating, wherein following administration said [polymeric coating being effective to achieve] formulation produces a bisoprolol plasma concentration of not more than about 1 ng/ml for at least about three hours, and thereafter provides a sustained release of bisoprolol that produces a therapeutic plasma concentration not later than about 12 hours following administration. [an initial lag of bisoprolol release *in vivo* of at least 4-6 hours following administration] and [thereafter maintaining] wherein said formulation maintains a therapeutic plasma [concentrations] concentration of bisoprolol for the remainder of [the] a twenty-four hour period measured from administration.

34. (NEW) The multiparticulate bisoprolol formulation according to claim 33, wherein the formulation releases bisoprolol in a manner that is independent of the local pH of the gastrointestinal tract.

35. (NEW) The multiparticulate bisoprolol formulation according to claim 1, wherein the formulation provides a sustained release of bisoprolol that produces a therapeutic plasma concentration not later than about 6 hours following administration.

36. (NEW) The multiparticulate bisoprolol formulation according to claim 1, wherein the formulation further comprises talc.

37. (NEW) The multiparticulate bisoprolol formulation according to claim 1, wherein the formulation comprises a substantially purified enantiomer of bisoprolol.

38. (NEW) The multiparticulate bisoprolol formulation according to claim 37, wherein the substantially purified enantiomer of bisoprolol is (S)-bisoprolol.

39. (NEW) The multiparticulate bisoprolol formulation according to claim 37, wherein the substantially purified enantiomer of bisoprolol is (R)-bisoprolol.

40. (NEW) The multiparticulate bisoprolol formulation according to claim 1, wherein the polymeric coating comprises at least one pharmaceutically acceptable film-forming polymer that forms an insoluble film of low permeability.

41. (NEW) The multiparticulate bisoprolol formulation according to claim 40, wherein the polymeric coating further comprises at least one pharmaceutically acceptable film-forming polymer that forms an insoluble film of high permeability.

PATENT

Customer No. 22,852

Attorney Docket No. 8680-0001-00

42. (NEW) The multiparticulate bisoprolol formulation according to claim 40, wherein the at least one pharmaceutically acceptable film-forming polymer that forms an insoluble film of low permeability is present in an amount greater than the amount of any pharmaceutically acceptable film-forming polymers that form an insoluble film of high permeability.
